Security Conference

Security in oneM2M

Rana Kamill
IoT Ecosystems Architecture Solution Manager, BT
Senior Representative, oneM2M.

06/12/2023
An integrated solution is needed

Highly fragmented market with small vendor-specific or sector-specific solutions.

Reinventing the wheel: Same services developed again and again/

Limited communication and high integration costs
Opportunities and problems

• **Diversity is the richness** that allows evolution and innovation: combination of services is the biggest opportunity for the future.

• But **fragmentation** of solutions and technologies is the enemy that is delaying and blocking the developments.

• **Simplify** the environment, remove the unnecessary duplicated solutions (economy of scale), **preserve** the necessary/opportune solution specialization by **interworking**.
oneM2M

- Open global de-jure Standard
- Specifies a common set of horizontal IoT services
- Interworks with existing IoT technologies
- Value proposition
  - Simplifies the life for IoT stakeholders
  - Minimize development, deployment and maintenance costs
- Interoperability testing and certification program
- Mature and commercially deployed technology
- Vendor independent => Essential building block for an IoT ecosystem
...and most importantly: **is a Global Standard** – not controlled by a single private company!
OneM2M standard is based on a “Store and Share” resource REST based paradigm.

The data may be made available in the platform to the other applications, interested applications are notified by means of subscription.

Privacy is ensured by a strict Access Control Management, which relies on underlying network security, providing a secure light solution.

OneM2M is heavily reusing underlying network functionalities, including TR069 and OMA DM management, LCS, subscription management, QoS, Charging, etc.

OneM2M is an interworking framework designed to connect the different IoT technologies.
oneM2M integrates the vertical silos!

oneM2M breaks down the vertical silos!
Work flow

- Energy
- Enterprise
- Healthcare
- Public Services
- Residential
- Industry
- Transportation
- Many others!!!

TS-0002

TECHNICAL REPORTS

TECHNICAL SPECS
Security in oneM2M Release 2- Release 4

Enrolment services (RSPF / MEF)
Credentials Provisioning/Security Configuration of the M2M System

Secure communications services (SAEF / MAF)
Methods for Securing Information (PSK/PKI/Trusted Party)
Point-to-point and end-to-end solutions (TLS / DTLS)

Access Control & Authorization services
Requester Authentication
Information access Authorization (ACL based)
Static and Dynamic solutions
Privacy Policy Management
oneM2M Secure Environment and security levels

« Secure Environment » concept abstracts the security implementation

- Expose common services to applications, depending on implementation.
- Provide common interface for remote security administration, if needed.

oneM2M supported implementations distinguish 4 security levels

- **No additional security.**
  Devices otherwise protected from attackers, i.e. on trusted networks.
- **Software only security (obfuscation, White box crypto etc.)**
  Always vulnerable to sufficiently motivated attacker.
  Acceptable when compromise is not critical.
- **« Trusted Execution Environment » (TEE) relying on main CPU hardware features**
  Good barrier against software based attacks.
  Sufficient for remotely accessible, but not physically exposed devices.
- **Tamper resistant hardware embedded Secure Element (eSE)**
  Required to protect secrets within devices physically exposed to attackers (SPA / DPA etc.)
  E.g. to protect unattended devices against cloning.
Summary of Release 2- Release 4 Features

Industrial Domain Enablement
- Time series data management
- Atomic Transactions
- Action Triggering
- Optimized Group Operations

Management
- M2M Application & Field Domain Component Configuration

Semantics
- Semantic Description/Annotation
- Semantic Querying
- Semantic Mashups
- oneM2M Base Ontology

Security
- Dynamic Authorization
- End to End Security
- Enrollment & Authentication APIs
- Distributed Authorization
- Decentralized Authentication
- Interoperable Privacy Profiles
- Secure Environment Abstraction

Home Domain Enablement
- Home Appliance Information Models & SDT
- Mapping to existing standards (OCF, ECHONET, GoTAPI...)

Smart City & Automotive Enablement
- Service Continuity
- Cross resource subscriptions

Market Adoption
- Developer Guides
- oneM2M Conformance Test
- Feature Catalogues
- Product Profiles

oneM2M as generic interworking framework
- 3GPP SCEF
- OMA LWM2M
- DDS
- OPC-UA
- Modbus
- AllJoyn/OCF
- OSGi
- W3C WoT

oneM2M Functions provided to applications.
oneM2M compliments existing proven security technologies to address IoT Security challenges.

oneM2M provides a common set of security capabilities to secure IoT devices and applications and prevent/mitigate attacks.

oneM2M exposes an abstracted set of security related APIs to help simplify security for IoT devices and applications.
Security in oneM2M Release 2-Release 4

Main security functions supported:

- Identification and Authentication
  - Identification: checking if the identity of the request originator provided for authentication is valid.
  - Authentication: validating if the identity supplied in the identification step is associated with a trustworthy credential.

- Security Association Establishment
  - Establishment of a security context between communicating entities to provide confidentiality (encryption) and integrity.
  - Range of authentication options supported.

- Authorization (Access Control)
  - Authorizing services and data access to authenticated entities.

- Remote Provisioning
Security in oneM2M Release 2-Release 4

Additional security functions:

- **Identity protection**
  - Capability to use pseudonyms to protect anonymity of transactions.

- **Sensitive data handling**
  - Capability to protect sensitive data (e.g. local credentials) and functions (e.g. data encryption/decryption) in a Secure Environment (e.g. Smart Card or Virtual Smart Cart)

- **Security administration (related to device management)**
  - Creates and administers dedicated Secure Environments and post-provisioning of master credentials.
Enrollment & Provisioning (Onboarding)

Onboarding is the procedure of bringing IoT Field Devices into operation in an IoT network. Procedures must cope with a large variety of field devices types and Service Provider’s business models.

OneM2M has specified an “M2M Enrolment Function“ (MEF) which enables stakeholders to setup their preferred onboarding and enrollment mechanisms in an interoperable way.

1) Field Device, provisioned with credentials, contacts MEF. MEF configures Field Device with parameters and credentials of an IN-CSE
2) Field device sends registration request to IN-CSE
3) IN-CSE authenticates the Field Device

optional, not in scope of oneM2M specifications
Enrollment & Provisioning (Onboarding)

M2M Enrollment Function can trigger the Field Device to execute a variety of procedures, including:

- Configuration of Field devices with registration parameters (e.g. oneM2M identifiers and contact information)
- Provisioning of symmetric keys
- Provisioning of certificates

*Keys and Certificates can be provisioned for securing oneM2M communication across a single communication “hop” or across multiple hops in an end-to-end fashion (see following slides).*

M2M Enrollment Function is operated by M2M Service Provider or trusted 3rd party (device manufacturer, underlying network operator, etc.)
M2M Enrolment Function (MEF)

M2M Enrolment Function allows 3 types of Remote Security Provisioning Frameworks (RSPF)
- Symmetric key authenticated RSPF
- Certificate authenticated RSPF
- GBA-authenticated RSPF; in this case the MEF is the Bootstrapping Server Function (BSF) of 3GPP Generic Bootstrapping Architecture (GBA)

MEF can trigger the Field Device to execute a variety of procedures, including:
- Configuration of Field devices with registration parameters and authentication profiles applicable to operational Security Frameworks (see next slide)
- Provisioning of symmetric key credentials
- Provisioning of certificates (certificate (re-)enrolment using EST and SCEP specified by IETF recommendations)

MEF is operated by M2M Service Provider or trusted 3rd party (device manufacturer, underlying network operator) Z
Message Security between adjacent Entities: The operational security framework

Uses (Datagram) Transport Layer Security Protocols, TLS/DTLS Version 1.2
Several Security Association Establishment Frameworks are supported:

1) Authentication and session key establishment using symmetric keys shared by devices
2) Authentication and session key establishment using Certificates provisioned to devices
3) Authentication facilitated by an M2M Authentication Function (MAF) hosted by M2M-SP or third-party

The MAF authenticates the end-points (PSK or certificates) and facilitates establishing a symmetric key
Authorization / Access Controls

oneM2M is based on a RESTful architecture
- API is based on requests to perform an operation on a resource
- Operations are Create, Retrieve, Update, Delete

oneM2M Service Layer supports **configurable access control policies** that define clear rules dictating, for each resource
- WHO is authorized to access,
- WHAT operations are allowed, and under
- WHICH conditions (e.g. time, location of entity)
Authorization / Access Controls

Resource access is authorized based upon satisfying at least one Access Control Policy (ACP) rule in one of the linked ACPs.
**Dynamic Authorization**

**Dynamic Authorization**: Originator or Hosting CSE requesting authorization of Originator – provided by a Dynamic Authorization System (DAS) Server

- Direct Dynamic Authorization: Hosting CSE submits request to DAS, Originator not communicating with DAS Server
- Indirect Dynamic Authorization: Originator submits request to DAS Server using info provided by Hosting CSE. Similar to Open Authentication (OAuth) mechanism
- DAS has multiple options for authorizing: Issue/update access control rules, assign Role(s) to the Originator, issue JSON Web Tokens (JWT)

**Direct Dynamic Authorization**

1. Request
2. Request (with parameters from step 1)
3. Response (with Token or dynamicACPInfo)
4. Response ('success')
Privacy Policy Manager

DAS: Dynamic Authorization System
AE: Application Entity
CSE: Common Services Entity
Privacy Policy Manager (PPM)

- The PPM is a personal data management framework.
- The PPM converts a User’s privacy preferences into access control information in order to protect the User’s Personally Identifiable Information (PII) from access by unauthorized parties.
- Access control information consists of static and dynamic access control policies (ACP).
- PPM uses a “Terms and Condition’s Mark-up language” to derive consensus between the User’s privacy preferences and an Application Service Provider’s privacy policies.
